'FLUID MECHANICS -II' EXPERIMENTS

SUBJECT: - Fluid Mechanics-II

CLASS: - Second Year Civil Engineering

LIST OF EXPERIMENTS

Sr. No.	Name of Experiment	Page No.	
		From	To
I	Determination of Chezy's and Manning's constants		
II	Determination of co-efficient of discharge for venturi-flume /standing wave flume		
III	Determination of pipe friction factor.		
IV	Determination of minor losses.		
V	Study of hydraulic jump.		
VI	Impact of Jet.		
VII	Trial on turbine.		
VIII	Trial on centrifugal pump.		
IX	Trial on reciprocating pump.		

Time Allotted for each Practical Session = 02 Hrs.

EXPERIMENT NO: 01

CHEZYS AND MANNINGS CONSTANT

AIM: To conduct an experiment to find discharge through open channel with various slopes and to find chezy's and manning's constant.

EXPERIMENTAL SETUP:

For conducting this experiment long hollow rectangular channel is used with bed slope adjustments, point gauge is kept on upstream side of channel to measure the depth of water. Inlet pipe is provided with flow regulating arrangement. Outlet of channel is directly taken to the measuring tank which is provided with piezometer tube arrangement outlet is provided with measuring tank.

THEORY:

In open channel water flows under atmospheric pressure, when water flows in an open channel, resistance is offered to it, which causes loss of energy. A uniform flow will be developed if the resistance is balanced by the gravity forces. The magnitude of the resistance when other physical factors of the channel are kept unchanged depends on the velocity of the flow. The following formulae are used to measure the velocity are :

Chezy's formula is $V=C\sqrt{(RS_o)}$

Where C= chezy's constant

R = Hydraulic mean radius

S_o = Channel Bottom Slope

Manning's formula is $V= (1/N)*R^{2/3}S_o^{1/2}$

Where N is manning's roughness coefficient

R is hydraulic mean radius

S_o is channel bottom slope

The relation between chezy and manning's formula is

$$C = (1/N)R^{1/6}$$

PROCEDURE:

1. Remove all the obstructions in the channel
2. Prepare the unit for open channel experiment by lifting both the gates so that there is no obstruction to the flow of water.
3. By screwing up the wheel of the tilting arrangement the required slope for the channel can be attained. Note the readings in the vertical scale as shown.
4. Allow the water in the channel, so that the water flows along the open channel at the steady condition.
5. With the help of the point gauge, find the head of water in the channel. Let it be $y= \underline{\hspace{2cm}}$ m
6. Take manometer reading L.

7. Calculate the discharge by using formula,

$$Q_{act} = C_d \cdot a \sqrt{2gh}.$$

8. Repeat Steps 1 to 6 for different readings . i.e. head of water and for different channel slope.

OBSERVATIONS:

1. Width of channel “ B ”= 30 cm
2. Diameter of orifice= 4.8 cm
3. Length of channel= 6 m

OBSERVATION TABLE:

S.NO	BED SLOPE(S _o)	C.B.	W.S	DIFF. “Y” (cm)	Manometer Reading “L”	h	Q _{act}	Hydraulic Depth “R”	V=Q/a	C	1/N	N
1	5/6000											
2	10/6000											
3	15/6000											
4	20/6000											
5	25/6000											
6	30/6000											

SAMPLE CALCULATIONS:

1. $Y = C.B - W.S.$
2. $h = L \cdot (13.6 - 1)$
3. $Q_{act} = C_d \cdot a \sqrt{2gh}$
Where $C_d = 0.611$
4. $R = \text{Area} / \text{Wetted Perimeter}$
 $= B \cdot Y / B + 2Y$
5. $\text{Velocity} = Q_{act} / \text{Area}$
6. $V = C \sqrt{RS_o}$
7. $V = (1/N) \cdot R^{2/3} \cdot S_o^{1/2}$

RESULTS:

1. Average value of chezy’s constant =C= _____
2. Average value of manning’s constant =N= _____

EXPERIMENT NO: 02

VENTURI-FLUME

AIM: To find Coefficient of discharge of venturiflume

APPARATUS: A flume fitted with venturiflume, point gauge, orifice meter, etc.

DESCRIPTION:

A venturiflume is a critical-flow open flume with a constricted flow which causes a drop in the hydraulic grade line, creating a critical depth.

It is used in flow measurement of very large flow rates, usually given in millions of cubic units. A venturimeter would normally measure in millimeters, whereas a venturiflume measures in meters.

Measurement of discharge with venturiflumes requires two measurements, one upstream and one at the throat (narrowest cross-section), if the flow passes in a subcritical state through the flume. If the flumes are designed so as to pass the flow from sub critical to supercritical state while passing through the flume, a single measurement at the throat (which in this case becomes a critical section) is sufficient for computation of discharge. To ensure the occurrence of critical depth at the throat, the flumes are usually designed in such way as to form a hydraulic jump on the downstream side of the structure. These flumes are called 'standing wave flumes'

PROCEDURE:

- The slope of the flume is adjusted as required.
- The bed level reading of the point gauge is recorded.
- A small quantity of water is allowed to flow through venturiflume. The water surface level readings at the entrance and throat of the flume are taken by point-gauge after steady conditions are reached.
- The manometer reading at the orifice meter is noted.
- 6-8 readings of the orifice meter are noted.
- By increasing the discharges, observe if the flume behaves as a standing wave flume. (Observation or demonstration only, if possible)

OBSERVATION:

- Diameter of the orifice=4.8 cm.
- Bed level of the flume:
 - a) At inlet = $S_1 =$ cm.
 - b) At throat = $S_2 =$ cm.
- Width of flume
 - a) At inlet = $b_1 = 30$ cm.
 - b) At throat = $b_2 = 10$ cm.

OBSERVATION TABLE:

	INLET			THROAT			MANOMETER					
SR	CB	WS	d1	CB	WS	d2	h'	h=h'*12.6	Qact	Qth	Cd.	
1												
2												
3												
4												
5												
6												

5) SPECIMEN CALCULATIONS:

1. $h = h' (13.6 - 1) = 12.6 \text{ cms.}$
2. $Q = C_d * a * \sqrt{2g * h} \text{ cc/sec.}$
Take $C_d = 0.611$
3. $Q_o = b_1 d_1 * b_2 d_2 * \sqrt{2g(d_2 - d_1)} \text{ cc.sec} / \sqrt{(b_1 * b_1 * d_1 d_1 - b_2 b_2 * d_2 d_2)}$
4. $C_d = Q_{act} / Q_{th}$

Result:

EXPERIMENT NO:3

DETERMINATION OF PIPE FRICTION FACTOR.

AIM: To determine Fluid friction factor for the given pipes.

Introduction and Theory

The flow of liquid through a pipe is resisted by viscous shear stresses within the liquid and the turbulence that occurs along the internal walls of the pipe, created by the roughness of the pipe material. This resistance is usually known as pipe friction and is measured in meters head of the fluid, thus the term head loss is also used to express the resistance to flow.

Many factors affect the head loss in pipes, the viscosity of the fluid being handled, the size of the pipes, the roughness of the internal surface of the pipes, the changes in elevations within the system and the length of travel of the fluid.

The resistance through various valves and fittings will also contribute to the overall head loss. In a well designed system the resistance through valves and fittings will be of minor significance to the overall head loss and thus are called Major losses in fluid flow.

The Darcy-Weisbach equation

Weisbach first proposed the equation we now know as the Darcy-Weisbach formula or Darcy-Weisbach equation:

$$h_f = f(L/D) \times (v^2/2g)$$

where:

- h_f = head loss (m)
- f = Darcy friction factor
- L = length of pipe work (m)
- d = inner diameter of pipe work (m)
- v = velocity of fluid (m/s)
- g = acceleration due to gravity (m/s^2)

The Darcy Friction factor used with Weisbach equation has now become the standard head loss equation for calculating head loss in pipes where the flow is turbulent.

Apparatus Description

The experimental set up consists of a large number of pipes of different diameters. The pipes have tapping at certain distance so that a head loss can be measure with the help of a U - Tube manometer. The flow of water through a pipeline is regulated by operating a control valve which is provided in main supply line. Actual discharge through pipeline is calculated by collecting the water in measuring tank and by noting the time for collection.

TECHNICAL SPECIFICATION:

Pipe: MOC = G.I./ P.U.

Test length = 1000 mm

Pipe Diameter:

Pipe 1: ID:

Pipe 2: ID:

Pipe 3: ID:

Experimental Procedure :

- 1) Fill the storage tank/sump with the water.
- 2) Switch on the pump and keep the control valve fully open and close the bypass valve to have maximum flow rate through the meter.
- 3) To find friction factor of pipe 1 open control valve of the same and close other to valves
- 4) Open the vent cocks provided for the particular pipe 1 of the manometer.
- 5) Note down the difference of level of mercury in the manometer limbs.
- 6) Keep the drain valve of the measuring tank open till its time to start collecting the water.
- 7) Close the drain valve of the measuring tank and collect known quantity of water
- 8) Note down the time required for the same.
- 9) Change the flow rate of water through the meter with the help of control valve and repeat the above procedure.
- 10) Similarly for pipe 2 and 3 . Repeat the same procedure indicated in step 4-9
- 11) Take about 2-3 readings for different flow rates.

Observations Table :

Length of test section (L) = 1000 mm = 1 m

Pipe 1

Internal Diameter of Pipe D= ___ mm

Cross Sectional Area of Pipe = ___ m²

Sr no	Qty (liter)	T sec	h1-h2 (mm)	V (m/s)

Pipe 2

Internal Diameter of Pipe D= ___ mm

Cross Sectional Area of Pipe = ___ m²

Sr no	Qty (liter)	T sec	h1-h2 (mm)	V (m/s)

Pipe 3

Internal Diameter of Pipe D= ___ mm

Cross Sectional Area of Pipe = ___ m²

Sr no	Qty (liter)	T sec	h1-h2 (mm)	V (m/s)

Calculations

Mean velocity of flow, $V = Q/A$ m/s

Where, $Q = 0.01/\text{time required for 10 lit in m}^3/\text{sec}$

According to Darcy- Weisbach Equation for frictional loss of head due to pipe friction:-

$$hf = h1 - h2 = \frac{f * l * V^2}{D * 2g}$$

In the above equation, everything is known to us except “f”

Conversion Factor :- 1 mm of Hg = 0.0126 m of water

Conclusion

1) The friction factor for pipe is as follows:

- Pipe 1 =
- Pipe 2 =
- Pipe 3 =

2) For same size pipe G.I./P.U. has more frictional loss compared to G.I./PU pipes

EXPERIMENT NO:6

IMPACT OF JET APPARATUS

AIM: To find the coefficient of impact of jet for vane, 'K'

(Stationary & Inclined).

APPARATUS:

1. Impact of Jet experimental Set up
2. Stopwatch

DESCRIPTION:

The apparatus consists of an Acrylic cylinder. At the center of the cylinder, a nozzle is provided. On the top of the cylinder, lever is provided for which fulcrum is given at one end. At another end of the lever, Balancing Weight is provided. On the lever, required vane is attached. A Movable Weight is provided on the scale to get lever balance. The discharge is led into the Measuring Tank.

PROCEDURE:

1. Fix a required vane (suppose a Flat Plate) to the lever.
2. Adjust the Balancing Weight so that the lever becomes horizontal.
3. Start the supply. The jet of water through the nozzle will impinge on the vane. The force due to impact of water will be acting on the vane in the upward direction. This will disturb the initial balance of the lever.
4. Suitably adjust the position of the Sliding (Movable) Weight, so that the lever becomes horizontal or takes the balanced position.
5. Adjust the Supply Valve and take few more readings / observations.
6. With different vanes attached, F, repeat the procedure.

EXPERIMENT NO:7

PELTON WHEEL TURBINE

AIM: To conduct a test on Pelton Wheel Turbine at a Constant Head

APPARATUS:

1. Pelton Wheel Turbine
2. Nozzle & Spear Arrangement
3. Pressure Gauges (03 Nos. – Range = 00 – 07 kg/cm²)

THEORY:

Pelton Wheel Turbine is an IMPULSE type of turbine which is used to utilize high head for generation of electricity. All the energy is transferred by means of Nozzle & Spear arrangement. The water leaves the nozzle in a jet formation. The jet of water then strikes on the buckets of Pelton Wheel Runner. The buckets are in the shape of double cups joined together at the middle portion. The jet strikes the knife edge of the bucket with least resistance and shock. Then the jet glides along the path of the cup & jet is deflected through more than 160 – 170 degrees. While passing through along the buckets, the velocity of water is reduced & hence impulse force is applied to the cups which are moved & hence shaft is rotated.

The Specific Speed of Pelton wheel varies at constant head.

TEST REQUIREMENTS:

The Pelton Wheel is supplied with water at high pressure by Centrifugal Pump. The water is converged through Venturimeter to the Pelton Wheel. The Venturimeter with manometer connection is to be determined. The nozzle opening can be positioned and decreased by operating Spear wheel at the entrance side of turbine. The Spear wheel can be positioned in 8 places, i.e. 1/8,2/8,3/8,4/8,5/8,6/8,7/8,8/8 of nozzle opening. The turbine can be loaded by applying loads on brake drums by means of placing the given loads on the loading arm also placing the given loads on the loaded turbine.

The speeds (r.p.m.) at the entrance can be measured with the help of Tachometer.

PROCEDURE:

1. Keep the nozzle opening at the required position.
2. Do the priming & start the pump.
3. Allow the water in the turbine to rotate it.
4. Note down the speed of the turbine.
5. Take the respective readings in the respective pressure gauges.
6. Load the turbine by putting the weights.
7. Note down the dead weights.
8. Also note down the Head level.
9. Repeat the same procedure for different loading conditions.

OBSERVATION:

EXPERIMENT NO:8

CENTRIFUGAL PUMP

AIM-: To determine the overall efficiency of a Centrifugal Pump.

APPARATUS-: Centrifugal Pump Set – Up, Stop Watch, Meter Scale, etc.

THEORY-: The hydraulic machine which converts mechanical energy into hydraulic energy is called as the pump. The hydraulic energy is in the form of Pressure Energy. If Mechanical Energy is converted into Pressure Energy by means of Centrifugal Force which is acting on fluid. This hydraulic machine is called as a Centrifugal Pump. A Centrifugal Pump consists of an impeller which is rotating inside a spiral / volute casing. Liquid is admitted to the impeller in an axial direction through a central opening in it side called the Eye. It then flows radially outward & is discharged around the entire circumference into a casing. As the liquid flows through the rotating impeller, energy is imparted to the fluid, which results in increase in both: the Pressure Energy, and the Kinetic Energy. The name of pump Centrifugal is derived from the fact that, the discharge of liquid from the rotating impeller is due to the centrifugal head created in it when a liquid mass is rotated in a vessel. This results in a pressure rise throughout the mass, the rise at any point being proportional to the square of the Angular Velocity & the distance of the point from the axis of rotation.

Principal parts of a centrifugal pump

PROCEDURE-:

- 1) Switch on the motor and check the direction of rotation of pump in proper direction.
- 2) Keep the discharge valve full open and allow the water to fall in main tank.
- 3) No doubt the speed of the motor is controlled by the hand tachometer.
- 4) The readings of suction and discharges are noted.
- 5) Note the power consumed by pump from energy meter.
- 6) Measure the discharge of the pump in the measuring tank by diverting the flow.
- 7) Take few readings by varying the discharge.

PRECAUTIONS-:

- 1) Priming is necessary if pump doesn't give discharge.
- 2) Leakage should be avoided at joints.
- 3) Foot valve should be checked periodically.
- 4) Lubricate the swiveled joints & moving parts periodically.

SPECIFICATIONS-:

Pump type -: Centrifugal Pump Type

Motor Power -: 05 HP

Energy Meter -: Electrical

Vacuum Gauge -: 0 to 760 mm of Hg (0 to -30 PSi)

Pressure Gauge -: 0 to 2.1 kg / cm²

EXPERIMENT NO:9

RECIPROCATING PUMP

INTRODUCTION

Reciprocating pump is a positive displacement plunger pump. It is often used where relatively small quantity of water is to be handled and delivery pressure is quite large. Reciprocating pumps are widely used as Automobile Service Stations, Chemical Industries, or as metering and dosing pumps.

The apparatus consists of a two cylinder, double acting reciprocating pump mounted over the sump tank. The pump is driven by DC motor. An energy meter measures electrical input to motor. Measuring tank is provided to measure discharge of the pump. The pressure and vacuum gauges provided to measure the delivery pressure and suction vacuum respectively

SPECIFICATIONS

1. Reciprocating pump - stroke length 16 mm, piston dia 22 mm. 2 piston, with air vessel on discharge side, suction 15 mm discharge 15 mm.
2. DC motor, 1 HP 1440 RPM.
3. Measuring tank – 300 X 400 X 300 mm height provided with gauge tube and funnel for diverting the flow into measuring tank or sump tank.
4. Sump tank – 600 X 500 X 300 mm height.
5. Measurements -
 - i) Pressure gauge 0 - 2 1 Kg/cm² for discharge pressure,
 - ii) Vacuum gauge 0 -760 mm Hg for suction vacuum,
 - iii) Energy meter for motor input measurement.

EXPERIMENTAL PROCEDURE

1. Fill up sufficient water in sump tank.
2. Open the gate valve in the discharge pipe of the pump fully .
3. Check nut bolts & the driving belt for proper tightening.
4. Connect the electric supply and switch on the supply.
5. Slightly close the discharge valve. Note down pump speed, delivery
6. pressure, suction vacuum, time for 10imps of energy meter & for flow measurement close the measuring tanks drain valve, take time for 10 lits.
7. Repeat the procedure for different gate valve closing . Take care that discharge pressure does not rise above 8 Kg/cm².

8. Change the speed and take readings for different gate valve openings.

OBSERVATIONS

Piston Dia (m) “D”	0.022
Suction Stroke (m) “l”	0.016
Volume per Stroke(m ³) “Vs”	_____
Volume of water collected (m ³)	10
Frictional Losses (m)	2

OBSERVATION TABLE:

1	2	3	4	5	6	7	8	9	10
Sr NO	pump Speed	Q th	Time to collect water	Q act	Vacuum Gauge (mm hg)	Suction Head	Pressure Gauge	Delivery Head	Total Head
1									
2

4									
5									

11	12	13	14	15
Output Power of pump	Time for 10 imp. "te" sec	Input Power	taking motor efficiency 80% (ISP)	Effeciency

CALCULATIONS

1. Volume per stroke = $\frac{\pi}{4} * D^2 * l * 2$
 $= \frac{\pi}{4} * 0.022^2 * 0.016 * 2.$

2. Theoretical Discharge,
 $Q_t = \frac{Vs * Np}{60}$

3. Actual Discharge
 $Q_{act} = 0.01/t$

4. Suction Head,

$$H_s = \frac{P_s}{1000} * 13.6$$

Where,

Sp, gravity of mercury = 13.6

Ps = Vacuum/Suction Pressure in mm of Hg

5) Delivery head -

Hd = Discharge pressure, Kg/ cm² x 10 m
(as 10 m of water = 1 Kg /cm²)

6) Total head where

Ht = Hs + Hd + 2 mtr

where, Frictional losses = 2 mtr.

7) Output power of pump

$$P_w = \frac{W * Q_a * H_t}{1000} Kw$$

where, W = Specific weight of water = 9810 N/m³

Qa = Discharge m³/sec.

Ht = Total head m

8) Input power to pump-Let time required for 10 indication mean pulse of energy meter be te sec. then,

$$IP = \frac{10 * 3600}{te * 1600} Kw$$

where,

energy meter constant is 1600 imp/Kwh.

9) Taking motor efficiency 80 %, we have input shaft power

$$S.P. = I.P. * 0.80$$

10) Overall efficiency of pump –

$$\eta = \frac{PW}{SP} * 100\%$$

Graph:

Result -:
